

ABSTRACT OF THE DISCLOSURE

A plurality of devices for reading document images are connected through a network. A master device and slave devices are set among the devices. Read conditions and image forming conditions are respectively notified to the slave devices by the master device. Each slave device reads an original document based on the read condition, and outputs the read image data attached with the image forming condition, to the print device. The print device prints image data from various read devices under the image forming conditions attached thereto, thereby to print image data from the plurality of read devices, integrated with each other.
